Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical agents.

Example 1; Page 315-317; 341pp; English

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 and AAA30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IT63 at a position 16 amino acids N-terminal of an endogenous proline in TW6 to form a sequence X-CC (AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous contains a protein of the properties of the profess of the pr antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. The present sequence represents cDNA encoding a human wild-type GPCR used in an exemplification of the invention. This was cloned and subjected to sitedirected mutagenesis (SDM) to generate DNA encoding the corresponding mutant of the invention

The invention relates to a method for treating a non-endogenous, constitutively active version of an endogenous human G protein-coupled receptor (GPCR) that has a transmembrane-6 (TM6) region and an intracellular-3 (IC3) region, by substituting a specific amino acid in the TM6 region with a different amino acid, and testing for constitutive cutivity. The method is useful for creating a constitutively active version of an endogenous human GPCR that compounds for identification of region and an intracellular loop 3 region. The altered human GPCR copolypeptides are useful for screening test compounds for identification of inverse agonists or partial agonists of GPCR polypeptides, which may have therapeutic uses. The altered GPCRs may also be used in vivo or in vito in biological research. A nucleic acid encoding the altered GPCR vitro in biological research. A nucleic acid encoding the altered GPCR research a transgenic animal expressing the altered GPCR remay be used to create a transgenic animal expressing the altered GPCR. The method allows screening for compounds that modulate the activity of human G protein-coupied receptor without the head-for provision of a creening of compounds against orphan receptors for which no ligand is currently known. This sequence represents CDNA encoding a human GPCR contents.
                                                                                                                                                                                                                                                                                                                                                                Creating a constitutively active version of an endogenous human G protein coupled receptor (GPCR) comprises substituting a specific amino acid in the transmembrane-6 region with a different amino acid, and testing for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ProSerabileuservalPheThrSerTyrLeuaspleusermetabnabilleserGli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a constitutively active, non-endogenous version of an endogenous human G protein-coupled receptor (GPCR). The GPCR is used for screening therapeutic compounds as inverse agonists, agonists or partial agonists. The GPCR can be also be used to elucidate and understand the roles of GPCRs in normal and diseased humans. The GPCR need not be purified and isolated to be used to screen for therapeutic compounds. The utility of the GPCR as a research tool is enhanced because the role of a particular receptor can be understood before the endogenous ligand is identified. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                               860
                                                                                                                                                                                                                                            880

```
The invention relates to a novel compound comprising a sequence targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) 49, that specifically hybridises with the nucleic acid encoding G protein-coupled receptor 49 and inhibits its expression. The compound of the invention demonstrates neuroprotective activity and may be useful for preparing a composition for treating neural or endocrine system disorders, as well as during gene and antisense therapy. The current sequence is that of the human G protein-coupled receptor (GPCR) 49 DNA of the invention.
                                                                                                                                                        New antisense oligonucleotide comprising a sequence targeted to a nucleic acid encoding G protein-coupled receptor 49, useful for preparing a composition for treating e.g., neural or endocrine system disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2724 BP; 665 A; 723 C; 554 G; 782 T; 0 U; 0 Other;

WPI; 2004-390329/36. P-PSDB; ADO29408. Novel mammalian G protein coupled receptors, useful for identifying compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease.

Claim 151; SEQ ID NO 1025; 542pp; English.

The invention relates to human and mouse G protein-coupled receptors (GPCRS) and nucleic acids encoding them. The invention also relates to sequences at least 9% identical to the GPCR proteins and nucleic acids of the invention; methods of treating, preventing and nucleic acids of the invention; methods of screening diseases compounds useful in the treatment of GPCR-related diseases; a transgenic compounds useful in the treatment of GPCR-related diseases; a transgenic compounds useful in the treatment of GPCR-related diseases; a transgenic computation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the transgenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising probes which hybridise to GPCR polynucleotides of the invention. The invention further discloses variants of the GPCR polypeptides and vectors comprising a GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, comprisions) disease or schizophrenia); cliscates of the adrenal gland; disorders of the colon or intestine comprisions); disperies or the disconders of the calon and infarction); muscular disorders; blood disorders or anaemia or leukaemia); immune disorders; blood disorders or AIDS); bone and joint disorders (e.g., autoimmune disorders or AIDS); bone and joint disorders (e.g., osteoarthritis, rheumatoid

cc arthritis, gout or osteoporosis); metabolic or nutritive disorders (e.g., obesity, enzyme deficiency-related diseases or vitamin deficiency-related diseases); and disorders of the kidney, liver, lung, breast, ovary, ctrus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a GPCR-encoding cruclaic acid of the invention. Note: The full sequence data for this content did not form part of the printed specification; those sequences cont shown were obtained in electronic format directly from WIPO at Cfp. wipo.int/pub/published_pct_sequences.

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention also relates to expression vectors and host cells comprising a nucleic acid of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention, antibodies which specifically bind a polypeptide of the invention, use of such antibodies for drug targeting; colypeptides and mucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal necessaries and nucleic acids and uterine fibroids. They may also be useful in wound healing and in contraception. The present

The invention relates to a method of identifying a mammal that will respond therapeutically to a method of treating cancer by administering an epidermal growth factor receptor (EGFR) modulator by comparing the level of a biomarker in a mammal before and after exposure to an EGFR modulator. The method comprises: (a) measuring, in the mammal, the level of a least one biomarker identified in the specification; (b) exposing the mammal to the EGFR modulator; and (c) measuring in the mammal the level of the biomarker, where a difference in the level in step (c) compared to step (a) indicates that the mammal will respond therapeutically to the method of treating cancer. The method and biomarkers are useful for identifying a mammal that will respond therapeutically to a method of treating cancer by administering an epidemmal growth factor receptor (EGFR) modulator. This sequence corresponds to one of the biomarkers whose levels of gene expression is measured in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlnSerLeuArgLeuAspAlaAsnHisIleSerTyrValProProSerCysPheSerGly 160

                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes the human G protein-coupled receptor (GPCR) known as HG38. The HG38 protein and corresponding nucleic acid, may be used in the method of the invention for detecting colon or lung cancer. The first method involves performing an assay to determine the amount of HG38 in a sample of colon or lung tissue, and comparing the amount of protein to standard, thus detecting expression of protein in sample, where the differential expression of protein in sample, where the differential expression of protein in sample when compared with the standard is diagnostic of colon or lung cancer. The second method involves hybridizing a composition comprising the HG38 coding sequence, or its complement, and a labelling moiety, to nucleic acids of a sample of colon or lung tissue under conditions to form at least one hybridization complex, detecting hybridization complex formation, and comparing complex formation to a standard, where the comparison reflects differential expression of the polynucleotide in the sample relative to the standard and is diagnosis before the patient is symptomatic. Anti-method enables eathier diagnosis before the patient is symptomatic. Anti-method enables eathier diagnosis before the patient is symptomatic. Anti-method enables eathier diagnosis before the patient is symptomatic.

```
The invention relates to nucleic acids and proteins (ADN19683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
other diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
patient by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising a
nucleic acid of the invention; use of such antibodies for drug targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and mucleic acids. The nucleic acids, polypeptides,
antibodies and methods are useful for diagnosing, prognosing and treating
cancer and other conditions such as psoriasis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistation syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                380
                                                                                                                                                                                                                                        Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    440
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               261 GGGGGCAGCTCTCCCAGGTCTGGTGTTGCTGAGGGGCTGCCCCACACACTGTCATTGC 320

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological call in a patient by detecting a mucleic acid at least 80% identical to those of the invention also relates to expression vectors and host cells comprising a nucleic acid of the invention, antibodies which specifically bind a polypeptide of the invention, antibodies which specifically bind a polypeptide of the invention, antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and mucleic acids. The nucleic acids, polypeptides, cancer and other conditions such as psoriasis, ischaemia, heart disease, attribodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, attributed and conditions such as psoriasis, ischaemia, heart disease, an encared conditions such as psoriasis, ischaemia, many also be useful in wound healing and in contraception. They may also be useful in wound healing and in contraception. They may also be useful in wound healing and in contraception. The present (ADN38683-ADN40064) proteins nucleic acids and t invention relates \$

```
The invention relates to a combination comprising CDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with wilson disease and comparison of a strandard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining the combination with molecules or compounds under conditions to allow specific binding; and detecting specific binding between each cDNA and at specific binding; and detecting specific binding between each cDNA and to proteins. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human cDNA which is differentially expressed in steroid-induced C3A liver cells. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for the data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ठे
                                                                                                 This invention describes a novel human G-protein coupled glycoprotein hormone receptors are important in the endocrine system and HG38 may be involved in development and function of the skeletal muscle, spinal cord, placenta and to a lesser extent, the brain. The transgenic animal may be useful for studying tissue and temporal specific expression or activity of the HG38 receptor, as well as for studying the ability of a variety of compounds to act as modulators of HG38 receptor activity
                                                                                                                                                                                                                                                                                                                                       366

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90643-Y90687), and to DNA encoding them (AAA30708-A30743) and AAA30775-A30779). The mutant proteins of the invention contain a contain a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous anino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acid 8 N-terminal of an endogenous proline in TM6 to form a sequence X-CC (AA)15-Fro. The endogenous aproline in TM6 to form a sequence X-CC (AA)15-Fro. The endogenous anino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous creaidues. The constitutively active GPCRs are useful for identifying antagonists and partial agonists for use as pharmaceutical contidating the roles of the receptors in normal and diseases and disorders associated with that receptors. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. Sequences AAA30709-AAA30775 and AAA30779 represent DNAs encoding the mutant human
                                                                                                                                   G protein-coupled receptor; GPCR; constitutively active;

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
